

Mangaonua Stream Gully restoration

Ngāti Haua Mahi Trust - Hone Pene
 022 0430029
 h.pene@xtra.co.nz

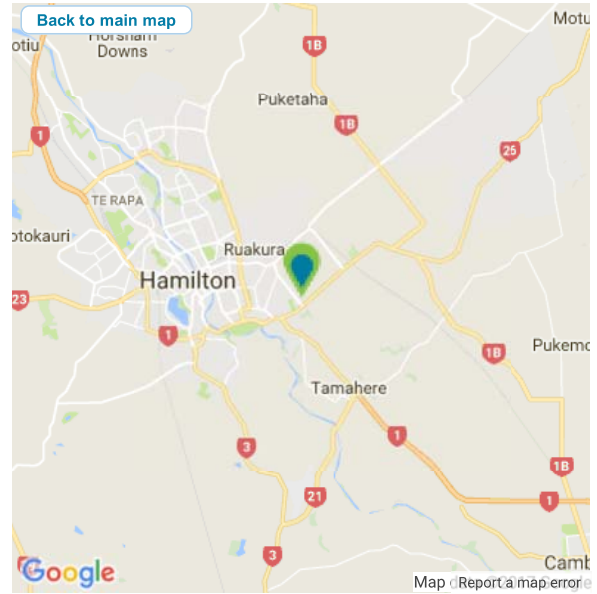

The project involves improving the Waikato River water quality through the establishment of native plants on the Mangaonua Gully System which will filter the water as it enters the waterway and minimize subsidence in the gully.

The project will include the clearance and maintenance control of pest plants and obnoxious weeds in a sustainable manner in order to protect the biodiversity of the whenua and water quality.

Our aim throughout this project is to have minimal or no spraying when we undertake this work. We will endeavour to prepare for the new plantings and develop and maintain walkway paths with minimal impact on the eco-system within the gully.

This project is funded by the Waikato River Authority (WRA 13-022)
